## EIKI LC-WXL200 Expand Serial Command Functional Specifications

### 1 Overview

- This Functional Specification defines communication with PJ-Net organizer for LC-WXL200.
- Supporting Firmware Ver. 1.x of the projector.
- Commands in this document are to communicate with PJ-Net organizer, but most commands are used to control a projector remotely from a computer with RS-232C. Therefore commands in this document are defined as Expand Serial Commands.

### 2 Serial Interface Specification

#### 2.1 Transfer Specification

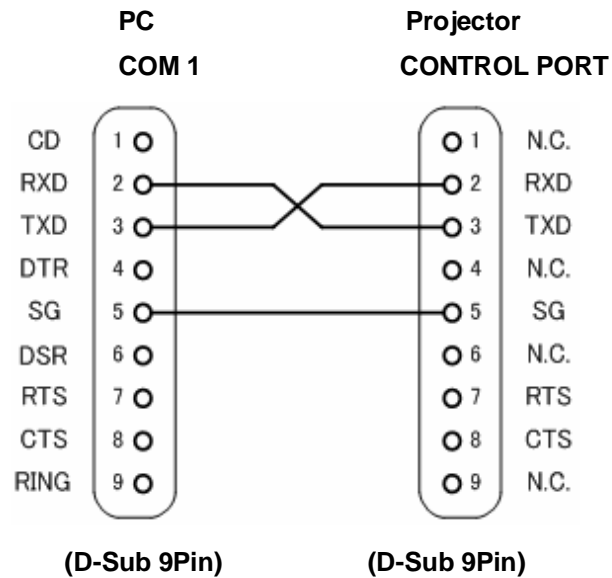

Item	Specification
Synchronous System	Asynchronous
Transmission Speed	9600 / 19200
Data Length	8 bits
Parity	N/A
Stop Bit	1
Flow Control	N/A

Note1) Transmission Speed: initial setting value is 19200

Note2) Transmission Speed can be changed in Service mode.

#### 2.2 Connection

Dedicated serial cables must be used for the connection between a computer and a projector.

Connect COM port of the computer to CONTROL PORT of the projector.

COM Port (COM1 or COM2) of a computer is specified by control software of the computer.

### 3 Notes for communication

1. Expand Serial Command is defined as a single command per line that starts with "C" and ends with carriage return (0x0D).
2. There are two types of commands; Functional Execution Commands and Status Read Command.
  - Example of Functional Execution Command: "CF\_BRIGHT\_032" [CR]
  - Example of Status Read Command: "CR\_BRIGHT" [CR]

Note) "\_" means a space

3. When it takes more than a second to receive a single command, it is not executed.  
When it takes more than a second to receive carriage return (0x0D) since the reception of the first data "C", it clears the information of the receive buffer.
4. When the command pipelining, allow the interval time of no less than 100ms after receiving return value.

5. Do not send another command before the reception of the return value; the operation by the command is not ensured.  
However this is not the case when no response is returned after more than 5 seconds.
6. It takes about 5 seconds for internal initialization after plugging in AC power. During this time, it cannot process commands. Do not issue any command.

### 4 Notation Convention

1. Data from a controller to a projector is represented as COMMAND, and data from a projector to a controller in response to the incoming command is represented as RESPONSE.
2. [CR]: Carriage Return Code  
Carriage Return code is added to the end of the command.  
Response is also followed by carriage return code.
3. \_: Space Code  
Space Code is represented as (\_).
4. %1: Parameter included in Command  
When there are more than one parameter, they are defined as %2, %3...
5. %%%: Error Code returned from a projector  
Acceptable: "000".  
Unacceptable: See [7. Error Code Table].

**9.12.5 CR\_TEMPFAIL Command**

Command	"CR_TEMPFAIL" [CR]	
Details	Get the temperature inside a projector when abnormal temperature status occurs. It is possible to get the temperatures all at once when several sensors installed.	
Response	Acceptable	"000_%1_%2_%3" [CR]
	%1,%2,%3	<p>%1 ----- Sensor 1 temp.                      %2 ----- Sensor 2 temp.                      %3 ----- Sensor 3 temp.                      e.g. "_31.5F"                      "_" indicates a space. When the temperature goes under 0, the first character is "-", not a space, as in "-05.5F".                      With more than one temperature sensors installed, projector returns responses in a row.                      e.g. "_31.5F _35.2S _38.0W" [CR]                      The first data indicates sensor 1 data, then one space, and sensor 2 data.                      Last character in each data indicates the sensor's status.                      "F" ----- Exceeding critical temp. (abnormal temp.)                      "W" ----- Approaching critical temp. (Warning temp.)                      "S" ----- Sensor temp. is safe (Safe temp.)                      "N" ----- Sensor detects no critical temp.                      "E" ----- Unable to return the temp. data</p> <p>The example 1 shows that sensor 1 indicates 31.5 degrees and the temperature is abnormal, sensor 2 indicates 35.2 degrees and the temperature is safe, sensor 3 indicates 38.0 degrees and the temperature is approaching critical state.                      When the temperature is safe, all data is represented as "_00.0S".                      When the projector is reset, "_00.0S" is set, and every time abnormal temperature occurs, it renews the data and returns it.                      In short, it only returns the renewed data of the latest abnormal temperature and the previous data is deleted.</p>

**9.12.6 CR\_TEMP Command**

Command	"CR_TEMP" [CR]	
Details	Get the current temperature information inside a projector. It is possible to get the temperatures all at once when several sensors installed.	
Response	Acceptable	"000_%1_%2_%3" [CR]
	%1, %2, %3	<p>%1 ----- Sensor 1 temp. (External temp.)                      %2 ----- Sensor 2 temp. (Internal temp.1)                      %3 ----- Sensor 3 temp. (Internal temp.2)                      %1, %2 are fixed 6 characters                      There is one space between %1 and %2                      There is one space between %2 and %3                      e.g. "_31.5F"]</p> <p>"_" indicates a space. When the temperature goes under 0, the first character is "-", not a space, as in "-05.5F".                      Last character in each data indicates the sensor's status.                      "F" ----- Exceeding critical temp. (abnormal temp.)                      "W" ----- Approaching critical temp. (Warning temp.)                      "S" ----- Sensor temp. is safe (Safe temp.)                      "N" ----- Sensor detects no critical temp.                      "E" ----- Unable to return the temp. data</p> <p>With more than one temperature sensors installed, projector returns responses in a row.                      e.g. "_31.5F _35.2S _38.0W" [CR]</p> <p>The first data indicates sensor 1 data, then one space, and sensor 2 data.</p> <p>The example 1 shows that sensor 1 indicates 31.5 degrees and the temperature is abnormal, sensor 2 indicates 35.2 degrees and the temperature is safe, sensor 3 indicates 38.0 degrees and the temperature is approaching critical state.                      When it cannot return the temperature data due to hardware error, the last character is "E" as in "_00.0E"                      It might happen for some projectors that the temperature continues to go up to abnormal status as long as lamp ballasts are hot. Therefore when in Standby mode or for several tens of seconds after Power is ON, any treatment of Power Failure is not processed. In that case, the temperature data is represented as "_ - - - N".</p>
